Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

```
1. (Currently Amended) An apparatus, comprising:
1
             a microphone;
2
             a codifier coupled to the microphone;
3
             a central processing unit coupled to the codifier to
4
   control the codifier to convert an analog signal sensed by the
5
   microphone into a [first] digital signal;
6
             at least one alert generator coupled to the central
7
   processing unit for generation of the at least one alert
8
9
   signal;
             a memory coupled to the central processing unit for
10
   storage of [the] an at least one predetermined value; [and]
11
             a programmable storage device readable by the
12
           processing unit, the programmable storage device
13
   tangibly embodying a program of instructions executable by the
14
   central processing unit, wherein the program of instructions
15
   and the at least one predetermined value define an alert
16
   sequence definition[.];
17
             the central processing unit responsive
18
   digital signal and the alert sequence definition [such that
19
   the central processing unit will determine] to select an alert
20
   signal [such that the central processing unit generates] by
21
   generating at least one control signal for the at least one
22
   alert generator [to generate the alert signal];
23
             a transceiver coupled to the central processing unit
24
   to communicate with an external device;
25
```

a decoder coupled to the central processing unit; 26 in the housing, a speaker mounted the speaker 27 28 coupled to the decoder; the central processing unit responsive 29 to transmitted signal of the external device received by the 30 transceiver wherein the central processing unit generates a 31 control signal for the speaker to generate a first analog 32 signal and the central processing unit generates a control 33 34 signal for the codifier to convert the reflected first analog signal sensed by the microphone into a first digital signal, 35 wherein, when the apparatus is placed in a container, the 36 first analog signal is reflected back toward the apparatus and 37 the codifier will convert the reflected first analog signal 38 39 into the first digital signal at a predetermined delayed interval; and 40 the central processing unit responsive to the first 41 digital signal to determine the strength of the reflected 42 first analog signal wherein the strength is compared with at 43 least one of the at least one predetermined thresholds stored 44

1 2. (Canceled)

45

- 1 3. (Canceled)
- 4. (Currently Amended) An apparatus as recited in claim 2 1 [3], wherein the at least one alert generator includes:
- a display mounted in the housing and coupled to the
- 4 central processing unit, the display having at least one
- 5 feature for generation of a visual alert signal.

in memory to determine an optimum alert signal.

5. (Currently Amended) An apparatus as recited in claim 1 [3], wherein the at least one alert generator includes:

- an audio alert generator coupled between the central processing unit and the speaker for generation of an audible alert signal.
- 6. (Currently Amended) An apparatus as recited in claim
 5, wherein the central processing unit responsive to the alert
 sequence definition, adjusts the type of the audible alert
 signal.
- 7. (Currently Amended) An apparatus as recited in claim
 5, wherein the central processing unit responsive to the alert
 sequence definition, adjusts the volume of the audible alert
 signal.
- 8. (Currently Amended) An apparatus as recited in claim
 5, wherein the central processing unit responsive to the alert
 sequence definition, adjusts the frequency of the audible
 alert signal.
- 9. (Previously presented) An apparatus as recited in claim 5, wherein the central processing unit responsive to the alert sequence definition, adjusts the interval of time for silence between a first and a second audible alert signal.
- 1 10. (Previously presented) An apparatus as recited in 2 claim 1, wherein the at least one alert generator includes: 3 a tactile alert generator coupled to the central 4 processing unit for generation of a tactile alert signal.
- 1 11. (Previously presented) An apparatus as recited in 2 claim 1, further comprising:
- at least one manually actuated user input coupled to the central processing unit;

- 5 wherein the programmable storage device responsive
- 6 to the at least one manually actuated user input to alter the
- 7 last alert signal generated.
- 1 12. (Previously presented) An apparatus as recited in
- 2 claim 1, further comprising:
- at least one manually actuated user input coupled to
- 4 the central processing unit;
- 5 wherein the programmable storage device responsive
- 6 to the at least one manually actuated user input to alter the
- 7 alert sequence definition.
- 1 13. (Currently Amended) An apparatus as recited in claim
- 2 1 [3], further comprising a housing wherein the microphone,
- 3 the speaker, the transceiver, and the at least one manually
- 4 actuated user input are mounted in the housing.
- 1 14. (Previously presented) An apparatus as recited in
- 2 claim 1, wherein one of the at least one predetermined value
- 3 includes at least one high frequency noise range.
- 1 15. (Previously presented) An apparatus as recited in
- 2 claim 1, wherein one of the at least one predetermined value
- 3 includes at least one low frequency noise range.
- 1 16. (currently amended) An apparatus as recited in claim
- 2 1, wherein the program of instructions includes speech
- 3 recognition processing instructions.
- 1 17. (Previously presented) An apparatus as recited in
- 2 claim 1, wherein the program of instructions includes neuron
- 3 network processing instructions.

- 1 18. (Previously presented) An apparatus as recited in claim 1, further comprising a radio link transceiver coupled to the central processing unit, the radio link transceiver positioned in the housing to communicate with a base station, wherein a transmitted signal from the base station, the predetermined values, and the program of instructions define the alert sequence definition.
- 1 19. (Previously presented) An apparatus as recited in 2 claim 18, wherein the radio link transceiver uses a short-3 range, cable replacement, radio technology such as 4 BluetoothTM.
- 1 20. (Previously presented) An apparatus as recited in 2 claim 1, further comprising a light sensor coupled to the 3 central processing unit to sense light external to the 4 portable wireless communication device, wherein the sensed 5 light, the predetermined values, and the program of 6 instructions define the alert sequence definition.
- 1 21. (Previously presented) An apparatus as recited in 2 claim 1, further comprising a motion sensor coupled to the 3 central processing unit to sense motion exerted on the 4 portable wireless communication device, wherein the sensed 5 motion, the predetermined values, and the program of 6 instructions define the alert sequence definition.
- 1 22. (Previously presented) An apparatus as recited in 2 claim 1, further comprising a temperature sensor coupled to 3 the central processing unit to sense temperature external to 4 the portable wireless communication device, wherein the sensed 5 temperature, the predetermined values, and the program of 6 instructions define the alert sequence definition.

- 1 23. (Previously presented) An apparatus as recited in 2 claim 1 wherein, the predetermined values includes a 3 temperature, motion, high frequency noise, and low frequency 4 noise range.
- 1 24. (Currently Amended) A method of generating an optimum 2 alerting sequence for a wireless communication device having a 3 central processing unit, a codifier, a memory, a programmable 4 storage device tangibly embodying a program of instructions, 5 plurality of alert generators, comprising the steps of:
- detecting, by the central processing unit, an incoming call;
- generating a first analog signal by a speaker,
 wherein when the apparatus is in a container, having an
 interior surface, the first analog signal will be reflected
 off of the interior surface of the container;
- sending a control signal to the codifier coupled to
 a microphone to receive the <u>reflected first</u> analog signal
 sensed at the microphone;
- 15 converting the <u>reflected first</u> analog signal to a 16 first digital signal;
- 17 retrieving a predetermined set of values and 18 coefficients from memory;
- determining the strength of the reflected first
 analog signal by the central processing unit responsive to the
 first digital signal such that the strength is compared with
 at least one predetermined threshold stored in a memory as
 input to determine an optimum alert signal;
- processing the <u>first</u> digital signal by the central processing unit to determine an optimum alerting sequence using a predetermine set of values, coefficients, and the

- 27 first digital signal as inputs for the program of instructions
- 28 tangibly embodied in the programmable storage device; and
- 29 generating an alert signal based upon the output of
- 30 the program of instructions.
- 1 25. (Previously presented) A method as recited in claim
- 2 24, wherein the program of instructions includes speech
- 3 recognition processing instructions to process a speech
- 4 pattern recognized in the digital signal as input to determine
- 5 the optimum alert sequence.
- 1 26. (Previously presented) A method as recited in claim
- 2 24, wherein the program of instructions includes neuron
- 3 network processing instructions to determine the optimum alert
- 4 sequence.
